

ALPMA SAN 60/V

ALPMA, the soft cheese packaging specialist, continues to ride the wave of success with its SAN 60/V packaging machine.

The SAN 60/V comes from the service-proven ALPMA "Sanitaire" series, called "SAN" for short. It is designed for the capacity range of 60 packs per minute. In their development work, ALPMA's engineers let themselves be guided by new customer demands. Top priority was placed on extremely short resetting times, greater flexibility and higher speed in adjusting to products of different sizes and shapes; on high reliability and optimum quality of wrap. Through the machine's vertical mode of operation, ALPMA ensures the gentle treatment of products plus the best possible presentation of the product.

An applied label can serve as an integrity seal and the machine allows the entire sealed face to be used for further customer information or an EAN code that can be printed large enough to meet retailer's requirements. Subsequent integration of in-line elements for quality assurance such as scales or metal detectors is also possible. And if the customer wishes, ALPMA is likewise able to supply just the right solution for the automatic unloading of the cheese and its insertion in splint boxes or cartons.

The SAN 60/V complies with the European Safety Directives and Hygiene Requirements (CE).
